

2.1 Operation Contract: assignEmployee

Operation: assignEmployee(userId : int, targetEmpId : int, date : LocalDate, type : ShiftType, role : Certification, isOvertime : boolean)

Cross References: Use Cases: Schedule Employees to Shifts

Preconditions:

1. An authorized Employee instance matching userId exists, and one of his certifications is HR.
2. The Employee instance matching userId is currently logged into the system session.
3. An Employee instance matching targetEmpId exists in the system memory.
4. A Shift instance uniquely identified by date and type exists in active memory.
5. The target employee is certified for the role and is available for the shift timeframe.

Postconditions:

1. Any active Shift instances whose dates are prior to the upcoming Sunday were removed from the activeShifts map within the ShiftMemory instance (association broken).
2. Those same archived Shift instances were added into the pastShifts map within the ShiftMemory instance (association formed).
3. The link between the target Employee ID and the specified role key was added to the assignments map within the targeted Shift instance (association formed).
4. If isOvertime evaluated to true, the targetEmpId was added to the overtimeEmployees array list within the targeted Shift instance (attribute modification).
