

1.2 Use Case Specification - Schedule Employees to Shifts

Field	Description
Use case name	Schedule Employees to Shifts.
Textual Description	The use case allows the HR manager to assign employees to shifts (morning/evening) for the upcoming week, taking into account employee constraints and preferences, while cross-referencing staffing requirements for planned deliveries (assigning drivers and warehouse workers for pending delivery slots).
List of Actors	HR Manager.
Pre-conditions	1. The user is logged into the system as an authorized HR Manager. 2. The HR manager has predefined the required job roles and specific staffing quantities needed per shift. 3. The system timeline is currently within the single week immediately prior to the target scheduling week (meaning scheduling can only begin the Sunday before the target Sunday–Saturday week).
Post-conditions	1. One or more shifts are updated with employee assignments and successfully saved in the system (partial scheduling is permitted). 2. If an assignment resolves a staffing need for an existing pending delivery, its status updates to Ready. 3. In cases of a constraint or role conflict where the manager triggers a manual override request, the request is generated and sent to the specific employee for their review and consent.

Main Success Scenario (Pseudo Code):

1. The user logs into the system using an authorized HR Manager ID and password.
2. The user navigates to the shift filling menu and requests to assign employees to an existing shift.
3. The user inputs the target day of the week and selects the shift type (Morning or Evening). The system displays an overview of the selected shift, listing the pre-defined required roles and current assignments.
4. The system presents the user with an option to view pending deliveries scheduled during that shift's timeframe.
5. The user selects the specific job role they want to fill for the shift.
6. The system displays a filtered list of all available employees who are certified to perform that specific role and are available during that timeframe.
7. The user selects the desired employee from the list and inputs whether this assignment counts as overtime.

8. If the user wishes to, they can repeat the previous steps until the shift is fully staffed.
9. The system validates the assignment against availability settings, updates the shift record, and prints a success message along with the updated shift details.
10. The system checks if the new assignment satisfies any existing delivery staff requirements, automatically updating any delivery statuses if all staffing conditions are met.

Alternatives & Extensions (Pseudo Code):

- **Extension: The user chooses to view pending deliveries.**
 1. The user selects the option to view pending deliveries scheduled during that shift's timeframe.
 2. The system displays a summary of unfulfilled deliveries, including required truck types, destinations (sites), and specific licensing requirements.
 3. The user closes the delivery view, and the process resumes at Step 6 of the Main Scenario.
- **Extension: There is no available employee for the selected role.**
 1. The system detects that no certified employee is available for the chosen role during this shift's timeframe.
 2. The system automatically creates a list of all employees who have the required certification for the role, regardless of their current constraints.
 3. The system presents this list to the HR Manager and provides an option to issue an override request.
 4. The HR Manager selects an employee from the compiled list and triggers the override request.
 5. The system generates an active request, sends it to the selected employee's account, and displays a confirmation message stating that the request has been sent for review.
 6. The current assignment step is suspended, and the process resumes at Step 6 of the Main Scenario, allowing the manager to continue filling other roles.
